# **VCAA 2005 Mathematical Methods Written Examination 2**

## **Suggested Answers & Solutions**

**Question 1** 

**a. i** ( 0, 2]

**ii** Interchange *t* for *y* and *y* for *t*:  $t = 2 e^{-y}$  and so 2  $\frac{t}{2} = e^{-y}$ Taking logarithm of both sides (to base *e*):  $log_e$ 2  $\frac{t}{2}$ ) = log<sub>e</sub>( $e^{-y}$ ) = -y Hence  $f^{-1}(t) = -\log_e(t)$ 2  $\frac{t}{2}$ ) and the domain is (0, 2]

**b. i** Using the Product Rule  $g'(t) = 2(t-1)e^{-t} - (t-1)^2 e^{-t}$  $= [2 t - 2 - (t^2 - 2 t + 1)] e^{-t}$  $= (-t^2+4t-3)e^{-t}$ 

Answers:  $b = 4$ ,  $c = -3$ 

- **ii**  $g'(t) = -(t-1)(t-3)e^{-t}$  $= 0$  for stationary values. This occurs at  $t = 1$  and  $t = 3$ . It should be noted that  $e^{-t}$  is never zero. When  $t = 1$ ,  $g(1) = 0$  and so one stationary value is  $(1, 0)$ . When  $t = 3$ ,  $g(3) = (3-1)^2 e^{-3} = 4 e^{-3}$  and so the other stationary value is  $(3, 4e^{-3})$ . Answers:  $p = 0$ ,  $m = 3$  and  $n = 4 e^{-3}$
- **iii**  $q(t) = 2(t-1)^2 e^{-t} 5$ Stationary points occur when  $q'(t)=0$ . ie.  $2g'(t)=0$  $g'(t)=0$ , so at t=1 and 3 This has stationary points at  $(1, -5)$  and  $(3, 8e^{-3} - 5)$
- **c i** If this has one stationary value only then the discriminant of the quadratic factor is zero.

 $\Delta = (2 - a)^2 + 4 (a - 10)$ Therefore  $4 - 4a + a^2 + 4a - 40 = 0$  $a^2 - 36 = 0$  and so  $a = \pm 6$ 

**ii** If  $h'(t) < 0$  for all *t* then the same discriminant must be negative as  $e^{-t} > 0$  for all *t* . Therefore  $a^2 - 36 < 0$  and so  $-6 < a < 6$ .

## **Question 2**

**a.** Greater than the A Standard: Probability = normalcdf (81.8,  $10^{10}$ , 80.8, 4.5) = 0.412 Greater than A but less than Olympic: Probability = normalcdf  $(81.8, 90.17, 80.8, 4.5) = 0.393$  Greater than Olympic: Probability = normalcdf (90.17,  $10^{10}$ , 80.8, 4.5) = 0.019

- **b.** Invnorm  $(0.1, 80.8, 4.5) = 75.03$  and so M = 75.03
	- **c.** Pr  $(X > A / X < Olympic) =$  $1 - 0.01866$  $0.4121 - 0.01866$ − −  $= 0.40$
	- **d.** The following table assists in finding this reward:

**ii** Binomial distribution:  $n=5$  and  $p = 0.393+0.019=0.412$ i.e. Bi(5, 0.412) Probability of at least three throws =  $Pr(X=3) + Pr(X=4) + Pr(X=5)$  $Pr (3) + Pr (4) + Pr (5) = {}^{5}C_{3} (0.412)^{3} (0.588)^{2} + {}^{5}C_{4} (0.412)^{4} (0.588)^{1} + (0.412)^{5}$  $= 0.2418 + 0.0847 + 0.01187$  $= 0.3384$ 

Answer: 0.338

- **iii** Expected number =  $n p = 5 \times 0.412$ Answer: 2.06
- **iv** Pr (Throws at least one Olympic Record) + Pr(Throws all five greater than Standard but less than Olympic)
	- $= (1 Pr (through one Olympic)) + 0.393<sup>5</sup>$
- $= (1 0.981<sup>5</sup>) + 0.393<sup>5</sup>$ 
	- $= (1 0.9085) + 0.0094$
	- $= 0.101$

## **Question 3**

**a.** 150 m

## **b.** 50 m

**c. i** 800 m

**ii**  $1200 - 800 = 400$  m

**d.** Solve  $y_1 = 100 \cos \left( \frac{\lambda (x - 400)}{600} \right)$ J  $\frac{\pi(x-400)}{200}$ l  $\int \pi(x-$ 600  $\left(\frac{\pi(x-400)}{600}\right)$  + 50 and y<sub>2</sub> = 20 to find intersection points on

the graphics calculator. The two values of *x* found are 41.81 and 758.19.

The length of the tunnel =  $758.19 - 41.81$ 

 $= 716$  m ( to the nearest metre).

e. 
$$
\int_{1200}^{800} (100 \cos \left( \frac{\pi (x - 400)}{600} \right) + 50) dx
$$
  
= 
$$
\left[ \frac{100 \times 600}{\pi} \sin \left( \frac{\pi (x - 400)}{600} \right) + 50x \right]_{1200}^{800}
$$
  
= 
$$
\left( \frac{60000}{\pi} \sin \left( \frac{400\pi}{600} \right) + 40000 \right) - \left( \frac{60000}{\pi} \sin \left( \frac{800}{600} \right) + 60000 \right)
$$
  
= 13080 m<sup>2</sup> (to the nearest square metre).

f. i 
$$
800 - 2k
$$
  
\nii  $400 + 2k$   
\niii  $C = (800 - 2k)^2 + (400 + 2k)^2$   
\niv  $\frac{dC}{dk} = 2 \times -2 (800 - 2k) + 2 \times 2 (400 + 2k)$   
\n $= -3200 + 8k + 1600 + 8k$   
\n $= 0$  for a minimum  
\n $0 = 16k - 1600$  and so  $k = 100$ .

**Question 4** 

**a.**  $y =$ 4 8  $\frac{p}{+}$   $\frac{q}{-}$ **b.**

Two features need to be shown here:

- the end-points need to be closed and filled in
- the addition graph is to have a minimum *above* the intersection of the two original graphs.
- **c.**  $y = \frac{y}{x+1} + \frac{1}{11-x}$ +  $+1$ <sup>11</sup> 4 1 9  $\frac{dy}{dx} = \frac{y}{(x+1)^2} + \frac{1}{(11-x)^2}$ 4  $(x+1)$ 9 *dx*  $(x+1)^2$   $(11-x)$ *dy* − + +  $=\frac{-9}{(1+3)^2}+\frac{4}{(1+3)^2}$  $\frac{y}{(x+1)^2} + \frac{1}{(11-x)^2}$ 4  $(x+1)$ 9  $(x+1)^2$   $(11-x)$ + + −  $= 0$  for a minimum value.
- **d. i** Now adding these two fractions together gives:

 $\frac{2(x+1)^2 + 4(x+1)}{(x+1)^2(1+x)^2}$  $^{2}$   $1/(x+1)^{2}$  $(x+1)^2(11-x)$  $9(11 - x)^2 + 4(x + 1)$  $(x+1)^2(11-x)$  $(x)^{2} + 4(x)$  $+1)^2(11 -9(11-x)^2 + 4(x+)$  $= 0$  If this fraction is zero then the numerator is zero:  $4(x+1)^2 - 9(11-x)^2 = 0$  This can be factorised using the difference of two squares:  $[2(x+1)-3(11-x)][2(x+1)+3(11-x)]=0$  $[2x + 2 - 33 + 3x][2x + 2 + 33 - 3x] = 0$  $(5x-31)(-x+35) = 0$ Hence  $x = 6.2$  is the only answer within the domain. When  $x = 6.2$  then the minimum is 2.083 (correct to three decimal places).

**ii** Solve  $\frac{x+1}{x+1} + \frac{1}{11-x}$ +  $+1$ <sup>11</sup> 4 1  $\frac{9}{2} + \frac{4}{11} = 5$  using the calculator to give  $x = 0.956$ .

The pollution level will be less than 5 for a journey from  $x = 0.956$  to  $x = 10$ , which is a distance of 9.044 km.

e. 
$$
\int_{0}^{10} \frac{9}{x+1} + \frac{4}{11-x} dx
$$
  
= 
$$
[9\log_e(x+1) - 4\log_e(11-x)]_{0}^{10}
$$
  
= 
$$
(9\log_e(11) - 4\log_e(1) - (9\log_e(1) - 4\log_e(11))
$$
  
= 
$$
13 \log_e(11)
$$
  
Answer: 
$$
31.17
$$
 correct to two decimal places.
