# MATHS METHODS (CAS) 3 & 4 TRIAL EXAMINATION 2 SOLUTIONS 2015

## **SECTION 1 – Multiple-choice answers**

	-	
1. E	9. D	17. A
2. C	<b>10.</b> C	18. D
3. E	<b>11.</b> E	19. E
4. A	12. D	<b>20.</b> C
5. B	13. D	21. B
6. C	14. D	22. C
7. D	15. D	
8. B	16. E	

SECTION I – Multiple-choice solution
--------------------------------------

#### **Question 1**

Do a quick sketch.  $r_f = [1,3)$ The answer is E.

## Question 2

The maximal domain occurs when  $x^2 - x - 6 \ge 0$  since the square root of a negative number is undefined for  $x \in R$ . Solve  $x^2 - x - 6 \ge 0$  for *x*.

 $x \le -2$  or  $x \ge 3$ 

In interval notation, this is expressed as  $x \in (-\infty, -2] \cup [3, \infty)$ . The answer is C.

## Question 3

Method 1 - intuitively  

$$y = \tan\left(\frac{\pi x}{4}\right)$$
  
period  $= \frac{\pi}{n}$  where  $n = \frac{\pi}{4}$   
 $= \pi \div \frac{\pi}{4}$   
 $= \pi \times \frac{4}{\pi}$   
 $= 4$ 

The graph of this function is dilated by a factor of 2 from the *y*-axis, that is, it is stretched horizontally by a factor of 2, so its period will be 8. The answer is E.

 $\frac{\text{Method } 2}{y = \tan\left(\frac{\pi x}{4}\right)}$ 

The graph of this function is dilated by a factor of 2 from the *y*-axis, so replace x with  $\frac{x}{2}$  in the equation.

$$y = \tan\left(\frac{\pi}{4} \times \frac{x}{2}\right)$$
$$= \tan\left(\frac{\pi x}{8}\right)$$

The period of this transformed function is  $\frac{\pi}{n} = \pi \div \frac{\pi}{8}$  = 8

The answer is E.

#### **Question 4**

The period of the graph is  $\pi$ . Since the period is  $\frac{2\pi}{n}, \frac{2\pi}{n} = \pi$  so n = 2.

The shape of the graph is that of an inverted  $\cos$  graph that has been translated 1 unit down so the rule could be  $g(x) = -\cos(2x) - 1$ . The answer is A.

I ne answer is A

### Question 5

Do a quick sketch of a possible graph.

There is a stationary point of inflection at x = 3. Note that there could be an *x*-intercept at x = 7 if the graph shown was translated vertically up but there doesn't have to be. The answer is B.

$$h(x) = x^{3} + 17x^{2} - 24x + 6$$
  
$$h'(x) = 3x^{2} + 34x - 24 = 0$$
  
$$(x + 12)(3x - 2) = 0$$

Stationary points occur at x = -12 and  $x = \frac{2}{3}$ . Do a quick sketch.

An inverse will exist if *h* is a 1:1 function. This will only occur if  $D = \left[-12, \frac{2}{3}\right]$ The answer is C.

#### **Question 7**

$$\int_{2}^{4} (1-3h(x))dx$$
  
=  $\int_{2}^{4} 1dx - 3\int_{2}^{4} h(x)dx$   
=  $[x]_{2}^{4} - 3 \times -1$   
=  $4 - 2 + 3$   
= 5  
The answer is D.

#### **Question 8**

 $f'(x) = e^{\sqrt{x}}, \quad x \ge 0$   $f(x) = \int e^{\sqrt{x}} dx$ So  $f(x) = 2e^{\sqrt{x}} (\sqrt{x} - 1) + c$  using CAS Since f(0) = 1,  $1 = 2e^0(0 - 1) + c$  c = 3So  $f(x) = 2e^{\sqrt{x}} (\sqrt{x} - 1) + 3$ The answer is B.

#### **Question 9**

 $E(X) = 0 \times 0.1 + 2 \times a + 3 \times b + 5 \times 0.2 = 2.6$ So 2a + 3b = 1.6 -(A) Also, 0.1 + a + b + 0.2 = 1a + b = 0.7 -(B) (B)  $\times 2$  2a + 2b = 1.4 -(C) (A) -(C) b = 0.2In (B) a = 0.5The answer is D.

Pr(no black balls) = Pr(W,W) + Pr(W,R) + Pr(R,W) =  $\frac{5}{10} \times \frac{4}{9} + \frac{5}{10} \times \frac{1}{9} + \frac{1}{10} \times \frac{5}{9}$ =  $\frac{30}{90}$ =  $\frac{1}{3}$ The answer is C.

## Question 11

 $y = x^{\frac{2}{3}} + 1$   $\frac{dy}{dx} = \frac{2}{3}x^{-\frac{1}{3}}$   $= \frac{2}{3\sqrt[3]{x}}$ When x = -1,  $\frac{dy}{dx} = \frac{2}{3 \times -1} = -\frac{2}{3}$ . So the gradient of the tangent is  $-\frac{2}{3}$  and the gradient of the normal is therefore  $\frac{3}{2}$ . Equation of normal:  $y - y_1 = m(x - x_1)$   $y - 2 = \frac{3}{2}(x - 1)$   $y = \frac{3}{2}x + \frac{3}{2} + 2$   $y = \frac{3}{2}x + \frac{7}{2}$ The y-intercept is  $\frac{7}{2}$ .

The answer is E.

$$f(x) = e^{\frac{x}{2}}, x \in R$$

$$(f(2x))^{2} = \left(e^{\frac{2x}{2}}\right)^{2}$$

$$= (e^{x})^{2}$$

$$= e^{2x} \quad (\text{NOT } e^{x^{2}})$$
Now, 
$$f\left(\frac{x}{2}\right) = e^{\frac{x'}{2}}$$

$$= e^{\frac{x}{4}}$$

$$\neq e^{2x}$$

$$f(2x^{2}) = e^{\frac{2x^{2}}{2}}$$

$$= e^{x^{2}}$$

$$\neq e^{2x}$$

$$f(4x^{2}) = e^{\frac{4x^{2}}{2}}$$

$$= e^{2x^{2}}$$

$$\neq e^{2x}$$

$$f(4x) = e^{\frac{4x}{2}}$$

$$= e^{2x}$$
So option D is correct.  
Note  $2(f(x))^{2} = 2\left(e^{\frac{x}{2}}\right)^{2}$ 

$$= 2e^{x}$$

$$\neq e^{2x}$$
The answer is D.

# **Question 13**

Since A and B are independent events,  $Pr(A \cap B) = Pr(A) \times Pr(B)$   $0.2 = 0.5 \times Pr(B)$  So Pr(B) = 0.4  $Pr(A|B) = \frac{Pr(A \cap B)}{Pr(B)}$   $= \frac{0.2}{0.4}$  = 0.5The answer is D.

$$Pr(X > 4) = \int_{4}^{6} \frac{1}{(x+2)\log_{e}(2)} dx$$
$$= 0.415037...$$

The closest answer is 0.4150. The answer is D.

#### **Question 15**

The two shaded regions shown in the two diagrams above are equal in area. The average value of g is h, as indicated in the second diagram. We want to find h.

shaded area in diagram 1 = shaded area in diagram 2 area of rectangle + area of  $\Delta =$  base × height

$$9 \times 2 + \frac{1}{2} \times 9 \times 3 = 9 \times h$$
$$\frac{63}{2} = 9h$$
$$h = 3.5$$

The answer is D.

#### **Question 16**

Do a quick sketch.

For *f*, f(1) = 1, the graph is continuous for  $x \in R$ , and the gradient is positive for 0 < x < 1 and x > 2. At x = 0 and x = 2, the graph has a sharp point; that is, it is not smoothly continuous and therefore is not differentiable at these points. Option E is not true. The answer is E.

a

x + 2ay = 6ax + 8y = a + 10 $\begin{bmatrix} 1 & 2a \\ a & 8 \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} 6 \\ a+10 \end{bmatrix}$ 

 $\Delta = 1 \times 8 - 2a^2 = 0$  for no solution or infinitely many solutions

$$2(4-a^2) = 0$$
  
 $2(2-a)(2+a) = 0$   
 $a = 2$  or  $a = -2$ 

If a = 2, we have

 $(B) \div 2$ 

$$x + 4y = 6 - (A)$$
  
2x + 8y = 12 - (B)  
x + 4y = 6 - (C)

Since (A) and (C) are the same line, there are infinitely many solutions for a = 2. If a = -2, we have

$$x-4y=6 \quad -(A)$$
$$-2x+8y=8 \quad -(B)$$

 $(B) \div -2$ x - 4y = -4 - (C)

Since the lines given by (A) and (C) are parallel, there can be no solutions. So there are infinitely many solutions only when a = 2. The answer is A.

#### **Ouestion 18**

Do a quick sketch.

Since Pr(X < 76) = Pr(Z > -2), then 76 must lie two standard deviations above the mean. Now 76-54=22 so the standard deviation is 11. So the variance of X equals  $11^2 = 121$ . The answer is D.

#### **Ouestion 19**

 $y = x^2 - kx$  and y = 3x - 4 $x^{2} - kx = 3x - 4$ (equation of intersection)  $x^2 - kx - 3x + 4 = 0$  $x^{2} + x(-k-3) + 4 = 0$ The graphs intersect at two distinct points when  $\Delta > 0$ .  $b^2 - 4ac > 0$ 

 $(-k-3)^2 - 4 \times 1 \times 4 > 0$ Solve this inequation for k using CAS k < -7 or k > 1. The answer is E.

Since area of P = area of Q, solve  $\int_{0}^{5} -x^{2}(x-5)dx = -1 \times \int_{5}^{u} -x^{2}(x-5)dx$  for u. Note that the x-intercepts of the graph of f occur at x = 0 and x = 5. Also, since area Q falls below the x-axis, we need to multiply the integral  $\int_{5}^{u} -x^{2}(x-5)dx$  by negative one to obtain the actual area. Using CAS, u = 0 or  $u = \frac{20}{3}$ .

Since u > 5,  $u = \frac{20}{3}$ . The answer is C.

#### **Question 21**

The relationship  $f(x+0.4) \approx f(x) + 0.4 \times f'(x)$  is an application of the approximation formula  $f(x+h) \approx f(x) + hf'(x)$  where h = 0.4.

To approximate 
$$\frac{1}{\sqrt[3]{1.4}}$$
, we use  $f(x) = \frac{1}{\sqrt[3]{x}}$  and  $f'(x) = \frac{-1}{3x^{\frac{4}{3}}}$   
so  $f(x+0.4) \approx f(x) + 0.4 \times f'(x)$   
becomes  $f(1+0.4) \approx f(1) + 0.4 \times \frac{-1}{3 \times 1^{\frac{4}{3}}}$   
 $= 1 - \frac{0.4}{3}$   
 $= 0.86666...$   
The approximation is 0.8667  
The answer is B.

#### **Question 22**

$$A = \text{shaded area}$$
  
= area of  $\triangle CDE$  + area of  $\triangle ABE$   
=  $\frac{1}{2} \times a \times a \times \sin(\theta) + \frac{1}{2} \times AE \times AB$   
=  $\frac{a^2}{2} \sin(\theta) + \frac{1}{2} \times a \cos(\theta) \times a \sin(\theta)$   
=  $\frac{a^2}{2} \sin(\theta) + \frac{a^2}{2} \cos(\theta) \sin(\theta)$   
Solve  $\frac{dA}{d\theta} = 0$  for  $\theta$  using CAS  
 $\theta = \frac{\pi}{3}$  since  $0 < \theta < \frac{\pi}{2}$   
The answer is C.

#### **SECTION 2**

#### Question 1 (6 marks)

**a.** At midnight on Sunday t=0.  $g(0) = 20 - 4 \sin(0)$ 

$$=20$$

The temperature is 20 °C at midnight on Sunday.

(1 mark)

b.

period =  $\frac{2\pi}{n}$  where  $n = \frac{\pi}{12}$ =  $2\pi \div \frac{\pi}{12}$ = 24 (1 mark)

- c.Since the amplitude is 4, the maximum temperature is 24 °C.(1 mark)The average temperature is 20 °C.(1 mark)
- **d.** Solve g(t) = 22 for  $t \in [0, 24]$ t = 14 or 22

(1 mark)

A quick sketch of the graph of y = g(t) shows that the temperature inside the greenhouse is above 22 °C for 8 hours a day between t = 14 and t = 22.

(1 mark)

Question 2 (15 marks)

c.

**a.** mean = 
$$E(X) = \int_{2}^{5} \left( x \times \frac{(x-5)^{2} + 1}{12} \right) dx$$
  
=  $\frac{47}{16}$  hours (1 mark)

**b.** Solve 
$$\int_{2}^{m} \frac{(x-5)^{2}+1}{12} dx = 0.25$$
 for *m*. (1 mark)  
 $m = 2.3318...$ 

The maximum time was 2.332 hours (correct to 3 decimal places).

(1 mark)

(1 mark)

(1 mark)

 $X \sim N(24, 0.3^2)$ Pr(X < x) = 0.8

x = 24.252486... (using the inverse normal function) Filters with a maximum diameter of 24.25mm (correct to 2 decimal places) can be used in a Mini car.

- d. Pr(X < 23.5) = 0.047790... (using the normal cdf function)  $0.047790... \times 700 = 33.4532...$  (1 mark) So 33 of the filters will fit in any car (to the nearest whole number)
- e. i. <u>Method 1</u> using transition matrices

# this car minor major $T = \begin{bmatrix} q & 0.6 \\ 1-q & 0.4 \end{bmatrix}$ minor next car $S_1 = \begin{bmatrix} 1 \\ 0 \end{bmatrix}$ major

 $T^{3} = T^{2}S_{1}$   $= \begin{bmatrix} q^{2} - 0.6q + 0.6 \\ -(q-1)(q+0.4) \end{bmatrix} \text{minor}$ The required probability is -(q-1)(q+0.4)or  $-q^{2} + 0.6q + 0.4$ (1 mark)

$$\frac{q}{1-q} \qquad \text{minor} \qquad (1 \text{ mark})$$

$$\frac{q}{1-q} \qquad (1 \text{ mark})$$

f.

# Question 3 (11 marks)

a.	From the diagram, we see that the maximum height occurs at the back wall of the b where $x = 10$ .		
	So $h(10) = 0.82822$		
	Height is 0.83m (correct to 2 decimal places).	(1 mark)	
b.	Solve $h'(x) = 0$ for x.	(1 mark)	
	x = 0.354001 or $x = 1.622882So the interval required is x \in [0.35, 1.62] where the endpoints are expresto 2 decimal places$	sed correct	
		(1 mark)	
c.	Solve $h'(x) = h(x)$ for x. x = 0.179568	(1 mark)	
	So $h(0.179568) = 0.142515$		
	The height is 0.14 metres (correct to 2 decimal places).	(1 mark)	
d.	Since the average rate of change of <i>h</i> between $(1,h(1))$ and $(p,h(p))$ is zero, then $h(1) = h(p)$ .		
	Solve $h(1) = h(p)$ for $p$ .	(1 mark)	
	p = 0.10541 or $p = 0.9999999$ or $p = 2.273895$		
	Since $p > 1$ , $p = 2.27$ (correct to 2 decimal places).		
		(1 mark)	
	10		
e.	volume of topsoil = $3 \times \int_{0}^{0} h(x) dx$	(1 mark)	
	=11.50244		
	The estimate for the volume of topsoil is 11.50 cubic metres (correct to 2	decimal	
	places).	(1 mark)	
f.	We are looking for the average value of the function <i>h</i> over the interval $x$	∈ [0,10].	
	average value = $\frac{1}{10-0} \int_{0}^{10} h(x) dx$	(1 mark)	
	= 0.383414		
	The height of the top soil would be 0.38 metres (correct to 2 decimal place	es).	

(1 mark)

Question 4 (12 marks)

a. 
$$f(x) = \log_e(x+a)$$
  
f is defined for  $x + a > 0$   
 $x > -a$   
So  $d_f = (-a, \infty)$ 

(1 mark)

b. i. <u>x-intercepts</u> occur when y = 0 $y = \log_e(x+a)$  $0 = \log_e(x+a)$  $e^0 = x + a$ 

> x + a = 1x = 1 - aIf the *x*-intercept is negative then 1-a < 01 < a*a* >1

> > (1 mark)

ii. From part i. the x-intercept occurs when x = 1 - a. If the *x*-intercept is positive then then 1-a > 01 > a*a* <1 Also, we are told in the question that *a* is positive so 0 < a < 1. (1 mark)

i.

then

c.

 $f(g(x)) = \frac{x}{b}$ Given  $\log_e(g(x) + a) = \frac{x}{b}$  $e^{\frac{x}{b}} = g(x) + a$  $g(x) = e^{\frac{x}{b}} - a$ as required.

(1 mark)

f(g(x)) is a composite function and f(g(x)) is defined iff  $r_g \subseteq d_f$ ii. Now  $d_f = (-a, \infty)$  from part a. To find the range of g, do a quick sketch. = g(x) when b  $r_g = (-a, \infty)$ 

Since  $r_g = d_f$ , then f(g(x)) is defined.

*-a* 

is positive

y = -a

d. i. 
$$f(x) = \log_e(x+a)$$
  
Let  $y = \log_e(x+a)$   
Swap x and y for inverse.  
 $x = \log_e(y+a)$   
 $e^x = y+a$   
 $y = e^x - a$   
So  $f^{-1}(x) = e^x - a$   
 $d_{f^{-1}} = r_f$   
Since  $r_f = R$   
then  $d_{f^{-1}} = R$   
(1 mark)

ii. Since  $f^{-1}(x) = e^x - a$  and  $g(x) = e^{\frac{x}{b}} - a$ , the transformation required to transform the graph of  $f^{-1}$  to the graph of g is a dilation from the y-axis by a factor of b units.

(1 mark)

e. Since a > 1, the x-intercept of the graph of f will be negative from part b. i. Do a quick sketch.

The x-intercept occurs at x = 1 - a from part b. so area required =  $\int_{1-a}^{0} f(x) dx$ =  $a \log_{a}(a) - a + 1$  square units (usin

(using CAS)

(1 mark) – correct integrand (1 mark) correct terminals (1 mark) correct answer

From part b, if a > 1 the graph of *f* has a negative *x*-intercept and if 0 < a < 1, the graph of *f* has a positive *x*-intercept.

f.

When a = 1, the graph of f passes through the origin hence the area enclosed by the graph of y = f(x) and the x and y axes equals zero. Alternatively, there is no area **enclosed** 

by the graph of y = f(x) and the x and y axes.

#### **Question 5** (14 marks)

a. The height of the land above sea level on the island, as seen from the naval ship is given by the function *l*. Define this function on your CAS. At sea level, l(x) = 0Solve l(x) = 0 for xx = 0 or x = 2000

So the width of the island as observed from the naval ship is 2000 - 0 = 2000 metres.

(1 mark)

**b.** Find l'(x).

Solve l'(x) = 0 for x x = 695.519033... (1 mark) Substitute this value into l(x). l(695.519033...) = 217.494939...The highest point on the island occurs at the point (695.5190, 217.4949) where coordinates are expressed correct to 4 decimal places.

(1 mark)

c. i. 
$$d(x) = b(x) - l(x)$$
  
=  $\frac{x^4}{10^{10}} - \frac{x^3}{2 \times 10^6} + \frac{19x^2}{2 \times 10^4} - \frac{7x}{10} + 200$  (1 mark)

ii. 
$$d_b = [0,3000]$$
  
 $d_l = [0,2000]$   
So  $d_d = [0,2000]$ 

(1 mark)

- d. Define d(x) (if you haven't already) on your CAS using your answer to part c. i. Find d'(x)Solve d'(x) = 0 for x x = 626.586096... (1 mark) Substitute this into d(x). d(626.586096...) = 26.781607...The minimum vertical distance between the balloon and the land is 26.78m (correct to 2 decimal places). (1 mark)
- e. Find l'(x). Substitute x = 1000 into l'(x).  $l'(1000) = -\frac{1}{10}$  (1 mark)

The equation of the tangent has a gradient of  $-\frac{1}{10}$  and passes through (1000,200).

The equation is given by

$$y - 200 = -\frac{1}{10}(x - 1000)$$
  
$$y = -\frac{x}{10} + 300$$
 (1 mark)

# © THE HEFFERNAN GROUP 2015 Maths Methods (CAS) 3 & 4 Trial Exam 2 solutions

# **f.** The missile crosses the flight path of the balloon when $b(x) = -\frac{x}{10} + 300$ . Solve this equation for x

Solve this equation for x.  

$$x = -1000(\sqrt{2} - 2) \text{ or } x = 1000(\sqrt{2} + 2)$$
  
 $= 585.7864... = 3414.2135...$ 

Since  $d_b = [0, 3000]$ , we reject this second value of *x*. So  $x = -1000(\sqrt{2} - 2)$ .

So  $x = -1000(\sqrt{2} - 2)$ . (1 mark) Note that the numerical values here are used only to see whether the values of x are feasible. Since we have not been asked for decimal approximations in the question, we must use the exact values of the coordinates.

Substitute 
$$x = -1000(\sqrt{2} - 2)$$
 into  $b(x)$  or into  $y = -\frac{x}{10} + 300$ .  
 $b(-1000(\sqrt{2} - 2)) = 100\sqrt{2} + 100$   
The missile crosses the flight path of the balloon at the point  $(-1000(\sqrt{2} - 2), 100\sqrt{2} + 100)$ 

To find the location of the balloon when the enemy missile crosses the flight path of the balloon, solve  $b(x) = 100\sqrt{2} + 100$  for x.

$$x = -1000(\sqrt{2} - 2)$$
 or  $x = 1000\sqrt{2}$ .

The balloon is located at the point  $(1000\sqrt{2}, 100\sqrt{2} + 100)$ . (1 mark) At this instant, Victoria fires a missile to hit the point (1000, 200).

gradient of path of missile

$$= \frac{100\sqrt{2} + 100 - 200}{1000\sqrt{2} - 1000}$$

$$= \frac{1}{10} \quad (1 \text{ mark})$$

$$m = \tan \theta$$
So  $\tan \theta = \frac{1}{10}$ 

$$\theta = \tan^{-1} \left(\frac{1}{10}\right)$$
So  $p = 10$ 
(1 mark)
$$(1000, 200) \quad \theta$$

$$(1000, 200) \quad \theta$$
